1	1. A method for transmitting a plurality of data types over a plurality of
2	transmission paths, comprising:
3	storing data of a plurality of compressed and non-compressed data types;
4	receiving requests for the stored data;
5	transmitting data of both the compressed and non-compressed data types
6	over each of a plurality of transmission paths; and
7	processing the transmitted data in accordance with the type of transmitted
8	data after the transmission of the data.
9	
10	2. The method of claim 1, wherein storing the compressed data types further
11	comprises placing the data in a plurality of First-In First-Out (FIFO) buffers.
12	
13	3. The method of claim 1, further comprising requesting the stored data by
14	introducing an identification pattern into a transmission request, the identification pattern
15	indicating the type of data requested.
16	
17	4. The method of claim 1, wherein transmitting data of both the compressed
18	and non-compressed data types further comprises transmitting the data identification
19	pattern associated with the data type being transmitted at the same time as the data being
20	transmitted.

5.	The method of claim 1, wherein transmitting data of both the compressed
and non-con	pressed data types further comprises transmitting Linework (LW) data over
any one of a	plurality of transmission paths.

- 6. The method of 1, wherein transmitting data of both the compressed and non-compressed data types further comprises transmitting Linework control (LWC) data over any one of a plurality of transmission paths.
- 7. The method of 1, wherein transmitting data of both the compressed and non-compressed data types further comprises transmitting continuous tone (CT) data over any one of a plurality of transmission paths.
- 8. The method of claim 1, wherein processing the transmitted further comprises reading a word of the data into a data decompression module every one half clock cycle.
- 9. The method of claim 8, wherein processing the transmitted data further comprises multiplexing the different types of data and processing each type of data received in accordance with the data type.
- 10. The method of claim 9, wherein processing the transmitted data further comprises losslessy decompressing the data when the data received is Linework (LW) data.

1	
2	11. The method of claim 9, wherein process
3	comprises losslessy decompressing the data when the
4	(LWC) data.
5	
6	12. The method of claim 9, wherein process
7	comprises decompressing the data when the data rece
8	
9	13. A method for transmitting a plurality of
10	transmission paths comprising:
11	storing data of a plurality of compressed and
12	plurality of First-In First-Out (FIFO) buffers;
13	requesting the stored data by introducing an i
14	transmission request, the identification pattern in
15	requested;
16	transmitting the identification pattern associa
17	transmitted at the same time as the data being tr
18	transmitting Linework (LW) data over any or
19	paths;
20	transmitting Linework control (LWC) data or
21	transmission paths;
22	transmitting continuous tone (CT) data over

11. The method of claim 9, wherein processing the transmitted data further
comprises losslessy decompressing the data when the data received is Linework control
(LWC) data.

- sing the transmitted data further eived is continuous tone (CT) data.
- of data types over a plurality of

non-compressed data types in a

dentification pattern into a dicating the type of data being

ated with the data type being ansmitted;

ne of a plurality of transmission

over any one of a plurality of

any one of a plurality of transmission paths.

	processing the transmitted data in accordance with the type	of	data	after	the
tr	ansmission of the data further comprising:				

reading a word of data into a decompression module every one-half clock cycle; multiplexing the different types of data and processing each type of data received in accordance with the data type;

losslessly decompressing the data when the data received is Linework (LW) data; losslessly decompressing the data when the data received is Linework control (LWC) data; and

decompressing the data when the data received is continuous tone (CT) data.

14. A system for transmitting a plurality of data types over a plurality of transmission paths comprising:

a memory module configured to store a plurality of compressed and noncompressed data types;

a handshaking control module configured to control the data flow into a data processing module; and

a data processing module configured to receive and process the transmitted data in accordance with the type of the transmitted data.

15. The system of claim 14, wherein the memory module further comprises a plurality of First-In First-Out (FIFO) buffers.

16. The system of claim 14, wherein the handshaking control module is further configured to receive data from a host and place the received data into the memory module.

- 17. The system of claim 16, wherein the handshaking module is further configured to place the data received into one of the plurality of FIFO buffers depending upon the type of data received.
- 18. The system of claim 14, wherein handshaking control module is further configured to receive requests for print data from the data processing module.
- 19. The system of claim 18, wherein the handshaking control module is further configured to place the data requested from the data processing module on the data bus appropriate for the data type requested.
- 20. The system of claim 19, wherein the handshaking control module is further configured to place continuous tone (CT) data upon a dedicated continuous tone bus.
- 21. The system of claim 19, wherein the handshaking control module is further configured to place Linework (LW) data upon the least busy of a plurality of buses used for either Linework (LW) or Linework control (LWC) data.

22. The system of claim 19, wherein the handshaking control module is
further configured to place Linework control (LWC) data upon the least busy of a
plurality of buses used for either Linework (LW) or Linework control (LWC) data.

- 23. The system of claim 14, wherein the data processing module if further configured to evaluate header information relating to a print job to determine what types of data to request from the handshaking control module.
- 24. The system of claim 23, wherein the data processing module is further configured to read one word of received data into a decompression module every one-half clock cycle.
- 25. The system of claim 24, wherein the data processing module is further configured to process each type of data received in accordance with the data type.
- 26. The system of claim 25, wherein the decompression module is configured to losslessly decompress Linework (LW) data.
- 27. The system of claim 25, wherein the decompression module is configured to losslessly decompress Linework control (LWC) data.
- 28. The system of claim 25, wherein the data processing module is further configured to decompress continuous tone (CT) data.
